3354KWH

1331.2V 2520AH

Overview

By combining a micro gas turbine with a Fresnel solar heat collector, the system effectively captures and reuses waste heat, achieving more than 90% efficiency. It also reduces reliance on fossil fuels by up to 35%, leading to significant cuts in both carbon and nitrogen oxide. This study proposes an innovative system for recovering waste heat from exhaust air after a regenerative thermal oxidiser process, integrating a Carnot battery and photovoltaic (PV) modules. The Carnot battery incorporates an organic Rankine cycle (ORC) with a recuperator, thermal energy storage. The electricity generated by the device can be used to supplement the alternator to reduce its torque load on the engine, charge. The Gen-H represents a departure from waste recovery technologies since it is (1) small-scale and mobile, (2) treats more types of waste more efficiently and (3) has. To improve primary energy utilization, Volkswagen and MAN are using an energy recovery system that converts.
