

# Briefly talk about the solar container principle of supercapacitors

## Overview

---

It is superficially similar to a conventional capacitor in that it consists of a pair of parallel-plate electrodes, but different in that the two electrodes are separated by an electrolyte solution rather than a solid dielectric. A solar supercapacitor, also known as a photovoltaic (PV) supercapacitor, is a device that combines the energy generation capabilities of solar cells with the superior energy storage and fast charging characteristics of supercapacitors. Supercapacitors are energy storage devices meant for applications that require high power, long lifetime, reliability, fast charge and discharge, and safety. The global solar storage container market is experiencing explosive growth, with demand increasing by over 200% in the past two years. Pre-fabricated containerized solutions now account for approximately 35% of all new utility-scale storage deployments worldwide.
