

Coal-fired power peak regulation or solar container support

Overview

Peak shaving demand, operation modes and new problems threaten the safety of units and relevant support policies were summarized and analyzed in this paper. With the development of new energy and the proposal of the “double carbon” target, accelerating the flexibility transformation of coal-fired generating units and guiding coal-fired generating units to participate in deep peak shaving have become an effective means of absorbing new energy to ensure. A solar-molten salt energy storage system based on multiple heat sources is constructed in this study. In the current context of energy transformation, this system helps achieve peak valley regulation and frequency modulation of the power network, improving the stability and security of a?

| Because batteries (Energy Storage Systems) have better ramping characteristics than traditional generators.
