

Current direction after inductor solar container

Overview

"The increase in current causes a back EMF (voltage) across the inductor due to Faraday's law of induction which opposes the change in current. What is the formula for inductor discharging?

$i = I_0 e^{-t/\tau}$ where I_0 is the initial current $(\tau = L/R)$ is the time. Kickback occurs when a very high voltage (thousands to tens of thousands of volts) is generated after applying voltage due to the magnetic fields breaking. At any particular point in the system, if the real power (kW) is flowing in one direction and the vars (kVAR) are flowing in the OPPOSITE direction the power factor is LEADING.

Positive and negative VARs and Solar inverter Grid connect schemas

The inverter is trying to push current into the grid, opposite the direction that the grid voltage wants to push current. This is hardest for the inverter to do at unity power factor.

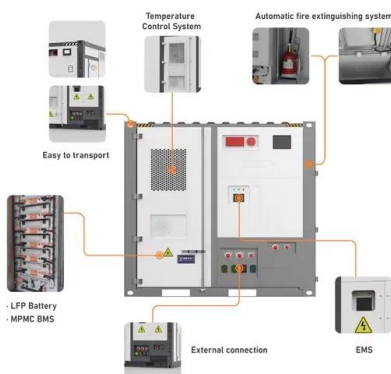

Inductor Back EMF Direction Relative to Changing Current
