

Does the transformer of the solar container power station work in both directions

Overview

The Futura High Power is equipped with an MV/LV transformer with a power output of up to 9 MVA, thus offering a wide range of connection options, including up to 40 LV outlets. This transformer container offers easy handling and comprehensive digital evaluation of all inverters as well as all necessary current and voltage values, temperatures and humidity measurements, making it the ideal cost-efficient park-internal transformer station for larger solar parks. A transformer is an electrical device that transfers electrical energy between two or more circuits through electromagnetic induction. To open up this concept, let's look at the generation side of things starting with inverters. Its core function is to convert direct current from solar panels into usable alternating.
