

# Film solar container capacitors

## Overview

---

These capacitors come with very specific advantages including non-polarity, a high insulation resistance, low dielectric losses and self-healing capability. Their power systems rely on DC/DC converters and DC/AC inverters that require capacitors to reduce low-frequency ripple, filter high-frequency components that cause electromagnetic interference (EMI), and absorb transient load currents to prevent them from affecting the primary side of the power. The generated electricity can be stored, used directly or fed into a large grid powered by central generating plants. The metalized layer is typically zinc, aluminum deposited onto the film in an extremely thin layer.
