

How much pressure is required for compressed air solar container power generation

Overview

The special thing about compressed air storage is that the air heats up strongly when being compressed from atmospheric pressure to a storage pressure of approx. At a utility scale, energy generated during periods of low demand can be released during peak load periods. Public reporting burden for this collection of information is estimated to average 1 hour per response, including the time for reviewing instruction, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information. A compressed air energy storage system is modeled to evaluate the operating conditions such as pressures, temperatures, time durations, compressor speeds, expander speeds, heating, and power requirements of the system.
