| The THERMO-Storea?

c thermal storage & exchange system consists of hot and cold salt tanks, heat exchanger, tubes, instruments, electric tracing, heat preserver and other auxiliary systems. ECOTHERM developed its pilot project for solar steam in 2015 as the first on-roof Fresnel system in Austria. Fluid from the low-temperature tank flows through the solar collector or receiver, where solar energy heats it to a high temperature, and it then flows to the high-temperature tank for storage. The collector will harness the sun's energy to heat the water, which then moves through the copper tubing and is stored in the insulated tank.
