

Iwc marine chronograph does not store power

LiFePO₄

Wide temp: -20°C to 55°C

Easy to expand

Floor mount&wall mount

Intelligent BMS

Cycle Life:≥6000

Warranty :10 years

Overview

When it's activated, there's a draw on the overall power which basically leads to a reduced power reserve (the watch won't run as long as it normally would without the chronograph on - could have an effect on timing in the lower end of the torque curve of the mainspring). I recently bought it and it runs wonderfully with zero issues, however, I noticed recently that the power reserve will get down to the edge of 2-days (IE: between 2 days and 1 day marker), not even yet in the red, and the watch will stop. How much wearing movement is required to maintain the power reserve level, and it seems even with Gen the answer is "too much". The problem that I was having is that when pausing the running chronograph and then trying to resume it, the chronograph would sometimes not start running again. A chronograph is a time keeping device that simultaneously tracks elapsed time on demand.

Iwc marine chronograph does not store power

What's your view on a 5 day power reserve?

I find the 5 day power reserve on my IWC Mark XX incredibly useful as I usually only wear it once or twice a week when I'm out to dinner etc. With a 3 day, if you're not wearing it a lot of the time, the ...
