

Large-scale application of sodium-ion battery solar container technology

Overview

In some applications, sodium-ion cells are now cheaper to manufacture than LFP batteries, making them especially attractive for stationary energy storage, grid balancing, and hybrid solar systems that require long cycle life and stable performance rather than maximum. This technology strategy assessment on sodium batteries, released as part of the Long-Duration Storage Shot, contains the findings from the Storage Innovations (SI) 2030 strategic initiative. The objective of SI 2030 is to develop specific and quantifiable research, development, and deployment. But unlike lithium, a somewhat rare element that is currently mined in only a handful of countries, sodium is cheap and found everywhere. Sodium-ion batteries, once pushed to the sidelines by sharply falling lithium prices, are gaining renewed attention as global market conditions change and customers reassess long-term energy storage options.
