

# National reserve solar power generation

## Overview

---

Operating Reserves and Variable Generation: A comprehensive review of current strategies, studies, and fundamental research on the impact that increased penetration of variable renewable generation has on power system operating reserves. The Crescent Dunes Solar Energy Project is a solar thermal power project with an installed capacity of 110 megawatt (MW) [4] and 1.1 gigawatt-hours of energy storage [1] located near Tonopah, about 190 miles (310 km) northwest of Las Vegas. Other operating reserves can be provided by offline generators that an operator can turn on when needed (known as 10-minute “quick start” units) but which cannot respond immediately as spinning reserves. Operating reserves help to restore balance to the system following large losses of resources. Solar power includes solar farms as well as local distributed generation, mostly on rooftops and increasingly from community solar arrays.
