

Nitrogen storage pressure

Overview

This is the pressure under which the tank is designed to operate safely and efficiently. Gaseous N₂ is usually stored in cylinders and piped to various points of use, so the storage area may be within the lab itself or a local storage room. Discover which system best meets your lab's specific requirements through detailed technical comparisons. Liquid nitrogen, a cryogenic fluid cooled below -320°F (-196°C), is widely used in medicine, manufacturing, food, and science. Inhalation of nitrogen in excessive amounts can cause dizziness, nausea, vomiting, loss of consciousness, and death.
