

# **Off-peak solar container electricity price policy**

## Overview

---

On- and off-peak hours and per-kWh charge (for energy supplied by SRP) equal to the SRP Time-of-Use Price Plan. Critical peak pricing signals higher energy prices to customers, encouraging them to conserve during those times, which can avoid the need to invest in additional generation and help keep electric costs down. A new analysis from energy think tank Ember shows that utility-scale battery storage costs have fallen to \$65 per megawatt-hour (MWh) as of October 2025 in markets outside China and the US. Peak rate differentials are expanding rapidly: The gap between peak and off-peak electricity rates has grown to 200-300% in many markets, with California leading at rates up to \$0. With an increasing number of jurisdictions considering alternatives to net metering policies to financially compensate behind-the-meter solar photovoltaics (PV), customer economics will increasingly depend on its ability to reduce demand charges.
