Overview

► Power plant controller (PPC): This controller is implemented in a basic form to monitor the overall operations of the solar farm at the point of connection (POC). PSCAD allows for the analysis of unbalanced faults, such as single-line-to-ground (SLG) or line-to-line-to-ground (LLG), a key characteristic distinguishing PSCAD models from other dynamic models that focus on positive sequence behavior (e. Keentel Engineering leverages cutting-edge simulation tools to deliver innovative solutions in power system analysis, high-voltage (HV) substation design, and renewable integration. The model consists of PV array, DC link capacitor, DC-DC buck converter, three phase six-pulse inverter, AC inductive filter, transformer and a utility grid equivalent model.
