

# **Soil inter-seasonal solar container**

## Overview

---

Low-temperature systems (such as Passive Annual Heat Storage (PAHS) and Annualized geo solar (AGS)) use the soil adjoining the building as a low-temperature seasonal heat store (reaching temperatures similar to average annual air temperature), drawing upon the stored heat for. The thermal energy can be collected whenever it is available and be used whenever needed, such as in the opposing season. Interseasonal Heat Transfer provides sustainable energy using a new form of on site renewable energy that channels naturally occurring heat from the sun down to the ground in summer and back to buildings in winter to heat buildings without burning fossil fuels. It is the most advanced new mode of solar centralized heating in the world, which can maximize the use of.
