

# Solar container cell principle

## Overview

---

**Working Principle:** The working of solar cells involves light photons creating electron-hole pairs at the p-n junction, generating a voltage capable of driving a current across a connected load. Many notions presented in this chapter will be new but nonetheless the general idea of how a solar cell works should be clear. Solar cells are often bundled together to make larger units called solar modules, themselves coupled into even. A solar cell is made up of two types of silicon semiconductors type, one is n-type silicon semiconductor type and another p-type silicon semiconductor. By integrating all necessary equipment within a transportable structure, these units provide modular, plug-and-play renewable energy systems.
