

Solar container new energy electrical simulation

Overview

This paper presents the design and simulation of a hybrid renewable energy system utilizing solar and wind energy sources with a backup generator. Variable electricity supply from renewable energy systems and the need for balancing generation and demand introduce complexity in the design and testing of renewable energy and storage systems. Several container ports are implementing an eco-friendly port (green port) concept. NREL's energy simulator can mimic the grids of the future—and now, this massive, virtual and real-world research platform can simulate water power, too. Energy system simulation modeling plays an important role in understanding, analyzing, optimizing, and guiding the change to sustainable energy systems. Solar photovoltaic systems are today present in all industries, from stationary applications (residential).
