## Overview

---

Superconducting grids could speed up the integration of large-scale renewables—offshore wind farms and remote solar plants alike—by offering an alternative to conventional technologies for bulk power transmission, with lower environmental costs and quicker deployment. At the same time, renewable sources such as wind and solar are expanding at a record pace – but often in remote locations far from consumption centers. This combination creates a single, big challenge: move far more sustainable electricity, much farther, much faster. 8-megawatt machine from Vestas Wind Systems, went up off the coast of Scotland in April, and bids for some upcoming North Sea wind farms. Advanced generators for off-shore large wind turbines with higher efficiency and easier grid integration. Wind power— already one of the fastest growing forms of power generation—will make a major contribution.
