

# Storage modulus of hyperelastic material

LFP 12V100

## Overview

---

The storage modulus, symbolized as  $G'$  (G-prime), represents the elastic portion of this response. A hyperelastic or Green elastic material [1] is a type of constitutive model for ideally elastic material for which the stress-strain relationship derives from a strain energy density function. In particular, this approach makes it possible to capture stiffening, softening, and. These moduli can be expressed in terms of the (complex) Fourier transform of the nondimensional shear relaxation function : where is the time-dependent shear relaxation modulus, and are the real and imaginary parts of , and is the long-term shear modulus.

### Storage modulus of hyperelastic material

The storage modulus represents the amount of energy stored in the material, which can be recovered after deformation (elastic behavior), while the loss modulus is related to the amount of energy
