## Overview

---

Molybdenum's presence in solar photovoltaic (PV) cells significantly boosts their efficiency and durability. They range from light, flexible panels for portable applications such as backpacks, to home roof-top installations with capacities typically from a few kilowatts up to around 20 KW and utility-scale systems producing hundreds of. These alloys have some seriously impressive properties, such as high melting points, excellent strength at high temperatures, good corrosion resistance, and high thermal. High efficiency thin film solar cells: Ultra-thin molybdenum foil (thickness  $< 50 \mu\text{m}$ ) serves as an excellent back contact electrode in CIGS (Copper Indium Gallium selenide) solar cells, improving light absorption and electron transport efficiency.
