

The significance of storage modulus testing of copper clad laminate

Overview

The UL MOT ratings are assigned for copper clad laminates and primarily measure the loss of copper adhesion to the adhesive layer. oldermask over bare copper (SMOBC) in which the laminate is submerged in molten solder. This test method provides useful information about the suitability of both clad and. Laminate sheets should be stored in ventilated, dry at room temperature under environment control, avoiding direct sunlight, rain and corrosive gas (storage condition has direct and important effect to the.
