

Use scrapped electric vehicle lithium batteries to store energy

Overview

Alternatively, retired EV batteries can be repurposed for use as stationary energy storage systems, helping to integrate renewable energy into the power grid, manage peak loads, and enhance energy security. The researchers investigated how battery chemistry, reuse and recycling influence the energy output and environmental impact of lithium-ion EV batteries. The analysis, published in *Science Advances* Batteries with reduced energy storage capacity can be repurposed to store wind and solar energy. Lithium ion battery recycling is an essential and rapidly evolving process aimed at recovering valuable materials from used batteries, particularly those used in electric vehicles (EVs), eMicromobility and 2 & 3 Wheelers, portables, and battery energy storage systems. This review provides a systematic comparison of LIB integration across four EV architectures including battery electric.
