

What does peak and frequency regulation of new solar container mean

Overview

Grid frequency regulation and peak load regulation refer to the ability of power systems to maintain stable frequencies (typically 50Hz or 60Hz) and balance supply and demand during peak and off-peak periods. Does peak shaving affect the power generation capacity of light-storage-hydrogen power. As global power grids shift toward renewable energy, maintaining frequency stability becomes increasingly complex. Traditional generation sources, such as coal and gas plants, provide natural system inertia, which helps dampen frequency deviations. It is generally necessary to count between €2,100 and €2,300 per kWp (kilowatt-peak or peak power) of photovoltaic cells (taking into account the total cost: supports, fixing, panels, inverters).
